Introduction and Overview

Cloud CLI tools, such as AWS CLI, allow users to interact with cloud services directly from the terminal, enabling automation and efficient resource management. This task involves installing the AWS CLI, configuring it with AWS credentials, and using it to perform basic operations like listing resources, uploading files to S3, and managing EC2 instances. CLI tools offer a faster and scriptable alternative to the AWS Management Console, improving productivity. By completing this task, you'll gain hands-on experience in cloud automation and resource control using command-line commands.

Objective

The goal of this project is to:

1. Learn Cloud CLI Basics – Install and configure AWS CLI to interact with cloud resources using command-line commands.
2. Manage Cloud Resources – Use AWS CLI to list cloud resources, upload files to S3, and manage EC2 instances efficiently.
3. Enhance Automation Skills – Gain hands-on experience in automating cloud tasks, improving efficiency over manual AWS Management Console operations.

Importance of Cloud CLI

Hands-on Learning & Efficiency – Cloud CLI provides direct interaction with cloud services, enabling faster and more efficient management compared to the web console.

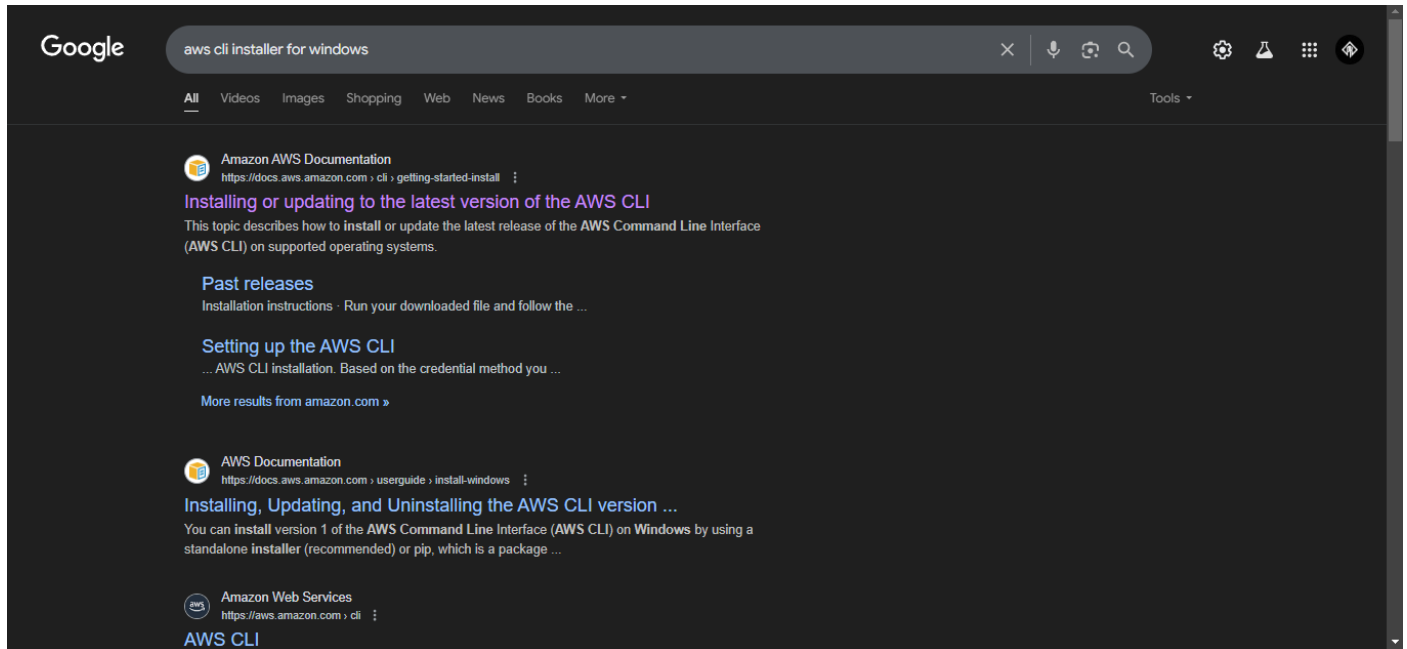

Automation & Scripting – It allows users to automate repetitive tasks, such as resource provisioning and deployments, improving productivity.

Remote Cloud Management – With CLI tools, users can manage cloud resources from any terminal, making it ideal for DevOps, remote administration, and large-scale cloud operations.

Step-by-Step Overview

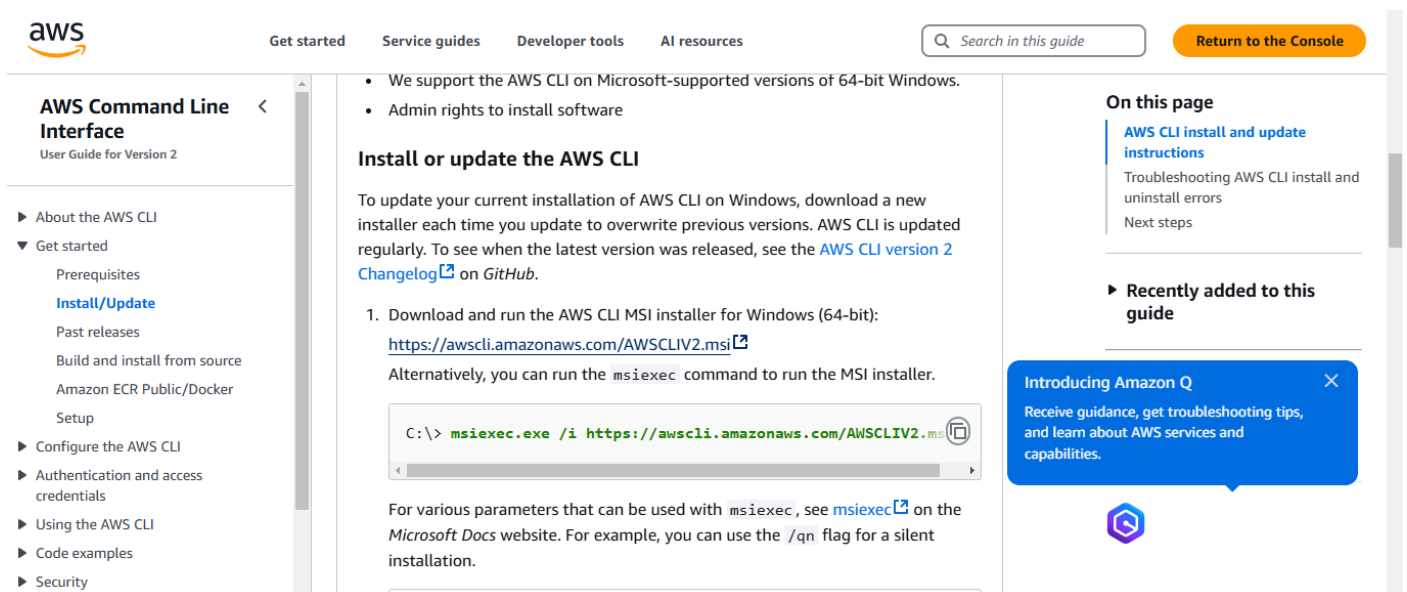

Step1:

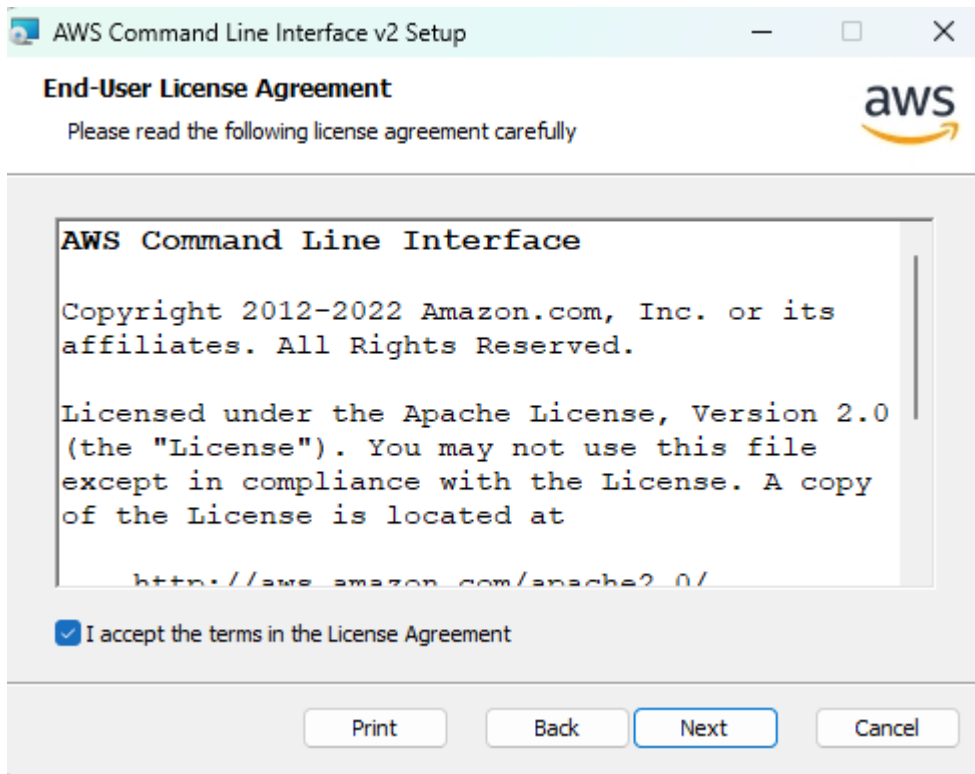

Search for "AWS CLI Installer for Windows" on Google and click the first link to access the official website.

Step 2:

Click on the "Install/Update" option located on the left-hand side of the Apache Lounge website. Select the link regarding your OS, Install by using the link provided else use the *msiexec* command

Step 3:

Once installed, verify the installation by opening Command Prompt (cmd) or PowerShell and running **aws --version**

```
C:\Users\ERW00446>aws --version
aws-cli/2.23.10 Python/3.12.6 Windows/11 exe/AMD64
```

It should return something like

aws-cli/2.x.x Python/3.x.x Windows/x86_64

Step 4:

Before using AWS CLI, you need to configure it with your AWS credentials.

Open Command Prompt and type **aws configure**

It will ask for:

AWS Access Key ID → Get it from AWS IAM > Security Credentials

AWS Secret Access Key → Get it from AWS IAM > Security Credentials

Default region name → Example: us-east-1 (Find yours in AWS Console)

Default output format → Keep it as json or press Enter for default

```
C:\Users\ERW00446>aws --version
aws-cli/2.23.10 Python/3.12.6 Windows/11 exe/AMD64
```

IAM > Security credentials > Create access key

Access key created
This is the only time that the secret access key can be viewed or downloaded. You cannot recover it later. However, you can create a new access key any time.

Step 1
Alternatives to root user access keys

Step 2
Retrieve access key

Access key
If you lose or forget your secret access key, you cannot retrieve it. Instead, create a new access key and make the old key inactive.

Access key best practices

- Never store your access key in plain text, in a code repository, or in code.
- Disable or delete access key when no longer needed.
- Enable least-privilege permissions.
- Rotate access keys regularly.

For more details about managing access keys, see the [best practices for managing AWS access keys](#).

[Download .csv file](#) [Done](#)

```
C:\Users\ERW00446>aws configure
AWS Access Key ID [*****WQKR]: 
AWS Secret Access Key [*****Like]: 
Default region name [ap-south-1]: ap-south-1
Default output format [json]: json
```

Step 5:

To see all storage buckets, Type **aws s3 ls** in cmd

To check running EC2 instances **aws ec2 describe-instances** in cmd

```
C:\Users\ERW00446>aws s3 ls

C:\Users\ERW00446>aws ec2 describe-instances
{
  "Reservations": [
    {
      "ReservationId": "r-0a40850a52f475658",
      "OwnerId": "271637264235",
      "Groups": [],
```

```
C:\Users\ERW00446>aws ec2 describe-instances
{
  "Reservations": [
    {
      "ReservationId": "r-0a40850a52f475658",
      "OwnerId": "271637264235",
      "Groups": [],
      "Instances": [

          "Architecture": "x86_64",
          "BlockDeviceMappings": [

              "DeviceName": "/dev/sda1",
              "Ebs": {
                "AttachTime": "2024-10-16T18:15:28+00:00",
                "DeleteOnTermination": true,
                "Status": "attached",

              }
            },

          "EnaSupport": true,
          "Hypervisor": "xen",

```

Step 6:

Create an S3 Bucket by typing **aws s3 mb s3://your-unique-bucket-name** in cmd

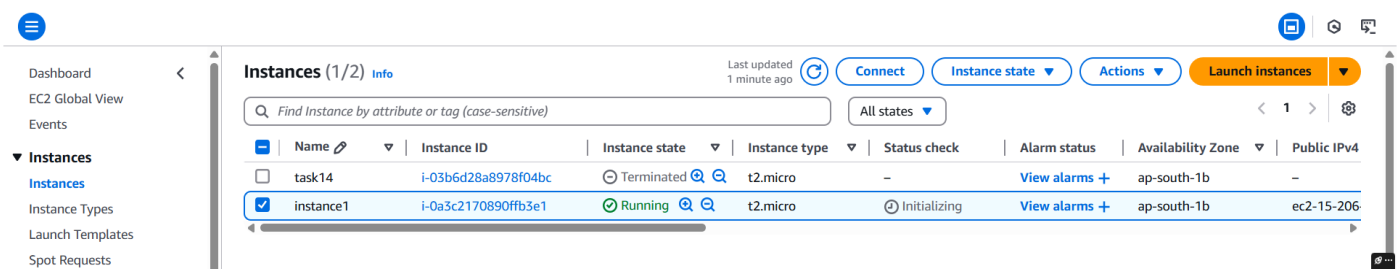

Upload a file to S3 Bucket by typing **aws s3 cp yourfile.txt s3://your-unique-bucket-name/** in cmd

Step 7:

To Start an EC2 Instance, Type **aws ec2 start-instances --instance-ids <INSTANCE_ID>** in cmd

Replace <INSTANCE_ID> with your actual instance ID

```
PS [redacted] > aws ec2 start-instances --instance-ids i-0a3c2170890ffb3e1
{
  "StartingInstances": [
    {
      "InstanceId": "i-0a3c2170890ffb3e1",
